Product management interview questions and sample answers

PMMockr practice worksheet | Updated 18 October 2026

Original practice cases, worked sample answers, and space to test your own reasoning. Free to use without signing in.

These cases, answers, and numerical inputs are hypothetical teaching material. They are not verified employer questions, recorded interviews, measured customer results, or a hiring rubric. A different user, goal, or constraint can justify a different answer.

How to use this worksheet

Attempt each case before reading its sample answer. Separate assumptions from facts.

Answer aloud, then introduce the follow-up. Explain how it changes your recommendation.

Compare the reasoning, not just the feature. Record one improvement and attempt a new case.

My target role, confirmed rounds, and next practice date

Full guide: https://www.pmmockr.com/pm-interview-questions

Preparation plan: https://www.pmmockr.com/pm-interview-prep-plan

Case 1: attempt first

Improve the airport pickup experience for late-night travelers.

My objective, user or segment, assumptions, alternatives, recommendation, and success measure:

Follow-up: What changes if poor driver availability, rather than wayfinding, is the main problem?

What changes in my recommendation, and why?

Case 1: worked sample answer

Original hypothetical practice case: improve airport pickup for late-night travelers. This is one possible answer, not an employer question or measured customer research.

1. Clarify the goal: I will focus on passengers leaving an unfamiliar airport after public transport closes. I would first confirm whether the main problem is finding the pickup point, getting a driver, or knowing the fare.

2. Choose a problem: assuming wayfinding is the main friction, compare clearer pickup directions, live driver guidance, and a staffed pickup desk. I would test terminal-specific directions first because they do not require continuous staffing or a driver app change.

3. Scope the release: show the exit, floor, pickup zone, and accessible route before the passenger leaves the terminal. Confirm airport rules and accessibility with operators before launch.

4. Measure: compare successful pickup completion and time from request to meeting the driver for this segment. Watch cancellations, safety incidents, and support contacts. Avoid claiming that faster pickup alone proves the experience is safer.

5. Handle a follow-up: if driver availability is actually the dominant problem, directions are insufficient. I would investigate supply and dispatch constraints before recommending this release.

Review your answer

Where did you explain a decision clearly? Which assumption needs evidence? What one change will you try on a different case?

Case 2: attempt first

Checkout starts stay at 1,000 while completed orders fall from 200 to 160. Diagnose the change.

My objective, user or segment, assumptions, alternatives, recommendation, and success measure:

Follow-up: What changes if the completed-order event stopped firing in the new app version?

What changes in my recommendation, and why?

Case 2: worked sample answer

Hypothetical practice data: checkout starts stay at 1,000 while completed orders fall from 200 to 160. Conversion moves from 20% to 16%: a fall of four percentage points, or 20% relative. These figures are teaching inputs, not PMMockr usage or customer results.

1. Confirm the time window, completed-order definition, event logging and whether starts and orders describe the same cohort.

2. Segment the change by app version, device, geography and payment method. Look for where the loss is concentrated.

3. Compare payment failures, available inventory, delivery fees and latency before choosing an explanation.

4. If the loss is concentrated in a new payment integration, inspect failed attempts and consider a targeted rollback with engineering. Treat this as a hypothesis until the evidence supports it.

5. After a fix, check completed orders and payment reliability alongside duplicate orders, cancellations and support contacts.

Where did you explain a decision clearly? Which assumption needs evidence? What one change will you try on a different case?

Case 3: attempt first

Should a budgeting app launch a paid plan for couples?

My objective, user or segment, assumptions, alternatives, recommendation, and success measure:

Follow-up: What evidence would make you stop the pilot even if people say they like the idea?

What changes in my recommendation, and why?

Case 3: worked sample answer

Original hypothetical practice case. The answer depends on assumptions that a real interview should clarify.

1. Clarify the objective: I will assess whether a couples plan can create sustainable paid value without weakening the individual budgeting experience. Ask about the current audience, retention, costs, and existing sharing demand.

2. Choose the initial segment: couples who already coordinate recurring household expenses but keep some spending private. Verify that need with research rather than assuming all couples want joint finances.

3. Compare options: a read-only shared budget, full shared accounts, or no launch. I would test a shared household budget with separate private accounts before attempting banking integrations.

4. Define a small test: invite an appropriate consenting group, explain data sharing clearly, and test whether both partners repeatedly complete the shared budgeting task. Evaluate willingness to pay separately from interest in a free feature.

5. Make the decision conditional: expand only if repeat use, paid demand, and support cost support the business case. Stop or redesign if privacy confusion or partner-invitation abuse appears. A useful pilot can reject the idea.

Where did you explain a decision clearly? Which assumption needs evidence? What one change will you try on a different case?

Your next case and review

Choose an original practice prompt. These are additional drills, not worked answers.

Execution: engineering says a promised launch will slip by six weeks. What do you do?

Technical PM: a public API is timing out for enterprise customers. How would you prioritize improvements?

Behavioral: tell me about a time you disagreed with engineering on a product decision. Use a real example; do not invent a result.

Self-review checklist

[ ] Did I state the objective and define the user or decision?

[ ] Did I distinguish evidence from assumptions?

[ ] Did I compare alternatives, recommend one, and name a trade-off?

[ ] Did I respond to the follow-up and define how to evaluate the decision?

One improvement and my next question

This checklist is for practice; it is not the PMMockr scoring formula or a predictor of an offer.
